KOROTEVA, K.F.

U.S.S.R.

Reaction of phenol with phosphorus. S. I. Vol'kovich, V. K. Kuskov, and K. F. Koroteva. *Izvest. Akad. Nauk S.S.R., Otdel. Khim. Nauk* 1954, 6-8.—Heating P with EtOH in an autoclave at 240–50° and 100 atm. gave a low yield of organo-P derivs., including those, b. 110–220°, whose structure was not detd. The gaseous products contained C<sub>2</sub>H<sub>4</sub>. At higher temp., noticeable amounts of decompr. products were observed. It is believed that the 1st reaction is dehydration of EtOH and the reaction of the resulting H<sub>2</sub>O with P; the resulting products then react with EtOH yielding the various products. PhOH does not react with red P in an autoclave, even at 500°, but in the presence of a little H<sub>2</sub>O reaction starts even at 200° with a rise in pressure to 40–150 atm. Thus, a well mixed mixt. of 23.5 g. PhOH, 6.8 g. red P, and 4.5 ml. H<sub>2</sub>O heated in an autoclave 4.5 hrs. at 250–65° and 110 atm., then allowed to cool over 12 hrs., gave a residual pressure of 20 atm. the gases being composed principally of H (99.5%). After diln. with H<sub>2</sub>O, the residual red P was filtered off (5 g.), washed with Et<sub>2</sub>O, the filtrates were warmed to expel Et<sub>2</sub>O and extd. with C<sub>6</sub>H<sub>6</sub>; evapn. of the C<sub>6</sub>H<sub>6</sub> gave 2 fractions: 2.8 g. PhPf<sub>2</sub>, b. 87–90°, b. 100°, and 1 g. Ph<sub>2</sub>Pf, b. 170°, b. 272°. Steam distn. of the PhOH from the aq. portion and evapn. of the residual soln. yielded 4 g. yellowish cryst. product, apparently crude PhPO<sub>2</sub>H<sub>2</sub>. In a similar expt. but with only 2.25 ml. H<sub>2</sub>O, heating 16 hrs. to 290° at 50 atm, again yielded Ph<sub>2</sub>Pf and a mixt. of acids of P. A mixt. of 8.2 g. red P with 23.2 g. dry NaOPh and 3.6 g. H<sub>2</sub>O heated in an autoclave over 4 hrs. to 250°/37 atm. pressure developed), kept there 3 hrs., allowed to cool 12 hrs. (residual pressure of 30 atm).

1068. EPIDEMIOLOGICAL CHARACTERISTICS OF BRUCELLOSIS IN THE  
UKRAINIAN SSR (Russian text) - Korotich A. S. - ZH. MIKROBIOL.  
1957, 5 (86-90) Vol. 28

In the course of the last few years a great task has been completed in the Ukraine in the fight against brucellosis among animals of economic importance. The considerable decrease in number of animals affected by the disease was followed by a steep drop in the human infection rate. In comparison with 1952 the number of foci among animals has dropped by 1955 3.7 times, the number of fresh human cases 3.6 times. In 70.6% of the human cases the source of infection had been infected goats or sheep, in 28.8% cattle affected by brucellosis, and in 0.6% diseased pigs. Most sufferers from brucellosis were villagers; only 19% were urban people. Men and women were equally suffering from the disease. The most menaced group was that from 40-49 yr. of age. The main contingent of brucellosis patients was constituted by labourers working on infected farms, especially people who were temporarily employed in such places: viz. milkers, herdsmen, veterinary personnel. Most infections occurred in June, but cases were also seen in April. For each professional category the chances of infection were greatest during a certain period of the year in connection with the character of the work and the most intimate contact with animals.

AUTHORS: Korotich, A.S., Kucherova, N.T., Mol'chenko, Ye.F., Netrebko, I.D.TITLE: Nutrient Media Which Accelerate the Growth of Brucella and Help in  
Detecting Them Among Concomitant MicrofloraPERIODICAL: Zhurnal mikrobiologii, epidemiologii i immunobiologii, 1960, Nr 3,  
pp 66 - 70 (USSR)

ABSTRACT: The authors investigated various nutrient media in an attempt to find one capable of accelerating the growth of Brucella, to produce a pure strain for diagnostic purpose. It was found that a good nutrient medium could be produced from fresh crude amniotic fluid of cattle, filtered through a Zeitz filter. In such medium Brucella could be cultured within 4 days, compared to the 9 days required for culturing in Huddleson's broth. To detect Brucella among concomitant microflora the specimen can be inoculated on liver agar with 1% glucose and 2% glycerine and with the addition of safranine (1:250,000) and malachite green (1:250,000), whereupon the brucella colonies stain bright red, dark red or ruby. Staining develops after 20 - 30 minutes. Differential staining of the colonies which have developed on the liver agar can be achieved by coating the

Sciences; Head of Publishing Board, V.P. Slobodcikov, and  
A.M. Kurnevi, Tech. Ed., Proj. Engineers.

PURPOSE: This book is intended for scientific and technical personnel  
in the field of metallurgy.

CONTENTS: This is a collection of articles on certain aspects of  
soviet metallurgy. The book is dedicated to Academician  
N.N. Semyonov's 75th birthday. The first part consists of  
articles written by Soviet experts on the occasion of his 75th birthday. The  
second part presents a brief account of the biography and  
professional activity of the Soviet metallurgist. It includes an  
introduction by Z. Chalman, Michaelas Granaus, and John Hilliard (U.K.),  
describing their meeting with Semyonov in Moscow and also his  
visit to the United States. The second part consists of three  
chapters and deals with new materials and finds for the Soviet  
metallurgical industry. The third part reflects the major  
problems of Soviet metallurgy. It consists of 25 articles dealing with  
various aspects of the metallurgy of iron and steel, aluminum,  
copper, magnesium, manganese, tin, zinc, and other metals.  
The fourth part contains a collection of articles on the  
development of metallurgical technology. The fifth part consists of  
articles on the development of various departments of the  
Soviet metallurgical industry. The sixth part contains a general  
index. References and tables are given after each article. No  
permissions are mentioned.

TITLE:

The Application of Tensometry in an Apparatus for Investigating  
the Kinetics of Reactions (Ispol'zovaniye tenzometrii v apparatu-  
rile issledovaniya kinetiki reaktsiy)

PERIODICAL:

Nauchnyye doklady vysshey shkoly. Metallurgiya, 1959, Nr 2,  
pp 250 - 251 (USSR)

ABSTRACT:

The method developed in the institute mentioned under "Associa-  
tion" is based on the measurement of the elastic deformation of  
a steel ruler by tensometer feelers. The apparatus is shown in  
figure 1. The steel ruler is clamped fast at one end, the sam-  
ple to be investigated is hung to the other end. The bending  
of the ruler by the weight of the sample is measured by means  
of the resistance change of 4 (2 upper and 2 lower) tensometer  
feelers. The scheme of the measuring bridge circuit according  
to the zero method is shown in figure 2. The authors see the  
advantage of this apparatus in the fact that - in contrast to  
balances - the sample remains hanging during the reaction to  
be investigated, making possible a continuous measurement of  
weight changes. The apparatus originally built for the investi-  
gation of reduction processes can also be applied to other

TITLE: A comparison of the diurnal variations of the occurrence of hydrogen emission and radioreflections at 72 Mc/s

PERIODICAL: Referativnyy zhurnal. Geofizika, no. 4, 1962, 23, abstract 4G142 (V sb. Spektr. elektrofotometr. i radio-lokats. issled. polyarn. siyaniy i svecheniya nochn. neba., no. 6, M., AN SSSR, 1961, 31-32)

TEXT: The diurnal variation of the occurrence of radioreflections from aurorae at 72 Mc/s is compared with the diurnal variation of the occurrence of hydrogen emission in the aurorae spectra. Systematic observations of the hydrogen emission were made at the Loparsk station (near Murmansk) using a spectrograph СП-47 (SP-47). Spectra of the whole sky were also taken. Radio observations were made over the whole 24-hour period. The author calculated the ratio of the number of observations of hydrogen emission to the total number of observations in each hour of the day, as well as the diurnal Card 1/2

A comparison of the diurnal ...

variation of the occurrence of hydrogen emission. A comparison of the diurnal variations of radioreflection and hydrogen emission showed coincident maxima at about 17 - 18 h (universal time), and in the morning hours during November-February. The maxima also coincide during the autumn months but then they occur near midnight. In winter, radioreflections are not observed during the daytime. It is probable that daytime hydrogen emission also does not occur, since the diurnal variations of radioreflection and hydrogen emission coincide. [Abstractor's note: Complete translation].

12.32.919

REF SOURCE: Tr. Soyuzn. n.-i. in-ta priborostro., vyp. 1, 1964, 36-43

TOPIC TAGS: radiation, neutron radiation, radiation dose rate, dosimeter, neutron detector

ABSTRACT: The difficulties were evaluated of designing an ideal dosimeter to measure the dose rate of neutron radiation over a wide energy range. Two methods were examined for designing a data transmitter with dosimetric characteristics in the energy range ranging from 0.025 ev to 20 Mev. The first method is based on the use of an inhibitor of a given width to insure the dosimetric character of the sensitivity curve and the thermal neutron detector. Transmitters,

TOPIC TAGS: neutron irradiation, neutron detection, fast neutron, thermal neutron, irradiation dosimetry, radiation instrument

ABSTRACT: The authors discuss the difficulty of constructin an "ideal" dosimetric instrument for neutron radiation in a wide energy range. Two methods of producing pickups with dosimetric characteristics in the energy range from 0.025 ev to 20 Mev are considered. The first is based on using a moderator of definite thickness, which ensures a definite dosimetric character of the variation of the sensitivity curve, and a thermal-neutron detector. Pickups based on this principle are arbitrarily called "isodose" pickups. The second method is based on using the characteristics of scintillation detectors for neutrons, namely the dependence of their sensitivity on the energy, which for a fixed ratio of the sensitivities of the fast- and intermediate-neutron detectors gives a satisfactory approximation of the dosimetric curve. The main shortcomings of these methods are indicated. A brief description is presented of the principle of combined dosimetric neutron detection, which is free

Card 1/2

L 32068-66

of many shortcomings inherent in the "isodose" pickup and the dispersion calibration, based on the method of scintillation dispersion detectors. The advantages of separated pickups over the "isodose," dispersion, and combination pickups are discussed.

TITLE: Simplified procedure for calculating the counting rate of detectors and determination of optimal dimensions of measuring volumes in the radiometry of beta-active gases

SOURCE: Ref. zh. Fizika, Abs. 1A498

REF SOURCE: Tr. Soyuzn. n.-i. in-ta priborostr. vyp. 1, 1964, 44-53

TOPIC TAGS: radiometry, scintillation counter, pulse counting, Beta detector, gas discharge counter

ABSTRACT: One of the most reliable and simplest methods of measuring the concentration of  $\beta$ -active gases is considered - the method of direct registration of the activity of the gas (contained in a limited volume) with the aid of gas-discharge or scintillation counters. It is noted that the analytic expressions that relate the counting rate of the detector with the concentration of the  $\beta$ -active gas are complicated and cumbersome when rigorous account is taken of the geometry of the measurement and absorption of the  $\beta$  radiation by the medium, so that their practical use is very limited. Since a calculation accuracy of ~15 - 20% is perfectly adequate for many problems, it is possible to simplify the formulas and make them more universal for the determination of the sensitivity for different geometries of the measuring gas volumes. The method of obtaining simpler qualitative relations consisted in the following:

TITLE: Surface quality in turning heat resistant materials

SOURCE: Ref. zh. Tekhnologiya mashinostroyeniya, Abs. 9B601

REF SOURCE: Tr. Kafedry proiz-va letatel'n. apparatov. Kuybyshevsk. aviat. in-t, vyp. 20, ch. 2, 1965, 163-174

TOPIC TAGS: metal surface, metal turning, heat resistant material; tensile stress, titanium alloy/VT14 titanium alloy

ABSTRACT: Test data are given on work hardening and residual stresses occurring during machining of VTZ-1 and VT14 titanium alloys, and EI787 heat-resistant steel, as well as on the relation between the temperature in the metal cutting zone and residual stresses. It was determined that during machining of type EI787 steel, the thickness of the work-hardened layer varies from 0.1 to 0.38 mm. At the same time, the thickness of the work-hardened layer decreases while the machining speed  $v$  and back rake angle  $\gamma$  increase. An increase in

Card 1/2

UDC: 621.941.001.5

ACC NO: AR7004877

feed (mm/rev)  $s$  and the wear of the cutting tool lead to a considerable increase in the thickness of the work-hardened layer. During machining of VT3-1 alloy, the thickness of the work-hardened layer varies from 0.12 to 0.28 mm and the intensity of work-hardening varies within 7—18%. Increase of  $s$  and wear of the tool lead to an increase in the thickness and amount of work-hardening, while increase of  $v$  and angle  $\gamma$  contributes to their decrease. In machining type EI787 steel, tensile stresses are observed in the upper machined surface layers; these stresses subsequently become compressive stresses. During the treatment of type VT3-1 and VT14 alloys, the surface shows compressive stresses. These stresses may reach a maximum of 20—27 kg/mm<sup>2</sup>. The compressive stresses then become tensile stresses. In machining the VT3-1 alloy, an increase in compressive stresses leads to an increase in fatigue strength. The original article has 9 figures and a bibliography of 4 reference items. L. Tikhonova.

TITLE: Investigation of machinability of VT3-1 titanium alloy and of EI787 heat  
resistant steel

CITED SOURCE: Sb. Obrabaty\*vayemost' zharoprochn. i titanovy\*kh splavov.  
Kuyby\*shev, 1962, 118-128

TOPIC TAGS: titanium alloy, heat-resistant steel, high-speed cutter, cutter,  
machinability, VT3-1, EI787, shavings shrinkage

TRANSLATION: Machinability investigation of VT3-1 alloy and EI787 steel was  
carried out with the purpose of studying the process of chip formation and  
characteristics of instrument wear, as well as in order to establish stability  
relationships. A lathe with a continuous control of the number of revolutions  
was used in the experiments. Dimensions of hard-alloy and high-speed cutters are  
as follows: gamma = 7° to 10°; alpha = 10°; lambda = 0°; phi = 45°; r = 1mm. It  
is established that at machining the VTZ-1 alloy the wear of hard-alloy cutters

Card 1/3

L 19199-63  
ACCESSION NR: AR3004197

is along the main rear and front surfaces, and up to a wear value of  $h_3 = 0.4$  to 0.5 mm the wear is uniform. At further work the wear increases fast. Cutters VK6M have the highest durability of all the hard-alloy cutters (at cutting at  $t = 2$  mm,  $s = 0.4$  mm/rev,  $v = 25$  mm/min,  $h_3 = 0.4$  to 0.5 mm). Slightly lower durability have VK8. Of the high-speed tools (at cutting at  $t = 2$  mm,  $s = 0.4$  mm/rev,  $v = 10$  m/min,  $h_3 = 0.4$  to 0.5 mm) the greatest durability have R9K10, slightly smaller -- the R9F5. Formulas are derived of relationships of  $v$  from  $s$ ,  $t$  and  $T$  from VTZ-1 which machining with VK6M and R9K10 cutters. At machining of the VTZ-1 alloy a small effect of cutting speed on shrinkage of shaving has been observed. This is explained by a low plasticity of the alloy; the shaving has an elementary character. Increasing gamma from  $0^\circ$  to  $10^\circ$  leads to an increase of shrinkage of shaving; and at further gamma increase the shrinkage decreases. Formula is given for cutting temperature theta as function of  $t$ ,  $s$  and  $v$ . It is determined that cooling by means of a 7%-emulsion, sprayed at a 4 atm pressure in the mixer, causes a substantial increase in the cutter durability. On the basis of dynamic investigations formulas are derived for determining cutting forces  $P_z$ ,  $P_y$  and  $P_x$ . It is also established that at machining of VTZ-1 the intensiveness of the hammered layer amounts to 7 to 18%; comparatively small increase in hardness of the hammered layer can be explained by high temperature in the cutting zone. The increase in  $v$  and  $s$  is limited by cutting temperature, by the coefficient of

Cord 2/3

L 19199-63

ACCESSION NR: AR3004197

longitudinal shrinkage and by the thickness of hammered layer. When the coefficient of longitudinal shrinkage is greater than 1.0, at  $t \times s = 2 \times 0.4$  mm, maximum limit speed can be taken at  $v = 30$  m/min and the maximum limit advance  $s =$  -- at less than 0.5 mm/rev. The greatest durability have the VK6M cutters when machining the EI787 steel, while the high-speed cutters have small durability. At the cutter wear of  $h_3 = 0.4$  mm the hammering intensiveness amounts to 37% and with a sharp cutter -- 17 to 20%. Formulas are given for determining the cutting speed, temperature and cutting forces  $P_z$ ,  $P_y$  and  $P_x$  in relationship to the fundamental parameters of the cutting process. Six figures, 4 references. S. Pinchuk.

TITLE: Characteristics of the absorptive activity of the small intestine under conditions of high temperature

SOURCE: AN UzbSSR. Otd. biol. nauk. Voprosy biologii i krayevoy meditsiny, no. 4, 1963, 389-393

TOPIC TAGS: intestinal absorption, water absorption, salt absorption, insulation

ABSTRACT: The absorption of 10-ml samples of tap water and isotonic (0.9%) or hypertonic (1.5%) saline (all at 37-38°C) by the small intestine was studied in four surgically prepared dogs fed a mixed diet, both at normal temperatures (18-20°C) and under conditions of high temperature (33-39°C) and exposure to sunlight (2 hours). Under normal temperature conditions, isotonic saline was absorbed at a uniform rate which varied from dog to dog and averaged 1.41-5.2 ml per 10 minutes; there was also absorption of chloride during this period (11.38-45.21 mg), and tap water was absorbed quite rapidly (5.1-7.67 ml/10 min.). Under high temperature conditions, however, the absorption of both water and chloride was sharply decreased (average of 11.8 and 44%, respectively). Hypertonic saline was not absorbed from the intestine under any conditions; in fact, the volume increased due to

Card 1/2

ACCESSION NR: AT4027407

excretion of body fluids, especially at high temperatures. Chloride, however, was absorbed more rapidly from hypertonic than from isotonic saline at normal temperatures (no absorption at high temperatures). The absorptive activity of the small intestine was partially restored within 2 hours after the dogs were transferred from direct sunlight to shade. Orig. art. has: 1 table.

Determination of alcohol in wine by osmometry.  
A. V. Korobtsev. Vinodel'sk i Vinogradarstvo S.S.S.R.  
8, No. 10, 50 (1947); cf. C. A. 43, 382a.—For wines above  
3% by vol.: Ale. is distd. from a 20-ml. sample into a 50-  
ml. volumetric flask, made up to vol. with dilut. water  
and the b.p. bnd. is noted. Corrections for change in b.p.  
due to wine antecedent are: at 50-54°, -0.38°; 55-57°,  
-0.30°; 56-58°, -0.20°; 57-59°, -0.15°; 58-59°,  
-0.25°; 59-60°, -0.10°. The amt. of ale. is then ded-  
ucted from normal taken and multiplied by 2. For wines having  
less than 3% alc.: A 50-ml. wine sample is used, the same  
corrections are applied to the b.p. but the multiplication  
factor is unnecessary. Deviations in results obtained by  
this method and by pyrometry do not exceed ±0.3.

Application of centrifuge for chemical control of zinc  
A. V. Korotkevich and A. P. Ponomarev  
Proceedings of the 5th All-Union Conference on the Application of  
centrifuges for the study of sugar beet, Vol. 1, p. 111  
USSR Academy of Agricultural Sciences, Moscow, 1959  
Received: 1959-09-01; accepted: 1959-09-11  
Revised: 1959-09-15  
Accepted: 1959-09-15

Abstract. An application of the ultracentrifuge for the chemical control of zinc in sugar beet is described. The method is based on the separation of zinc hydroxide from the solution by means of a precipitating agent.

The method is based on the separation of zinc hydroxide from the solution by means of a precipitating agent.

CH  
Tannins of grapes and their diffusion into wines. A. V. Korotkevich, Z. I. Gafurovskaya, and A. P. Kravchenko (All-Union Sci. Research Inst. Vinicult. and Viticult., "Magarach" Yalta, Crimea). *Biolim. Vinaadeliya, Akad. Nauk S.S.R., Sbornik 3, 26-42(1950)*. . . The method of Korotkevich (*Vinodelie i Vinogradarstvo S.S.R.*, No. 10 (1946)) for det. of the total amt. of tannides (I) in grapes and wines was modified to det. separately the tannin (II) and the coloring substances (III) constituting I. In 40 different red-varieties of grapes investigated the amt. of I varied from 255 to 2230 mg./100 g. berries with an av. of 1577 mg. for 1946 (dry summer) and 500 mg. for 1947 vintage (moist weather), resp.; the amt. of I per 100 g. of peels was on an av. 3.5 and 1.96, while that of seeds was 17.7 and 8.0 g., resp. Nearly 1/3 of I of grapes are located in the seeds. In peels, the amt. of III was 3.4% (in 1946) and 8.0% of I (in 1947). From 3 to 40% of the grape I diffused into wine during the fermentation, mainly at the expense of the peel's I. The diffusion was increased by a thorough crushing of the grape peels and seeds, by warming the grape pulp, and by increasing the alc. concn. of the medium to 10-15%. In wines, the amt. of II and III varied from 0.35 and 0.05 to 2.04 and 0.34, with an av. of 1.08 and 0.16 g./l., resp. The amt. of III in some wines was as high as 23% of I. E. Wierbleki

KOROTKEVICH, A.V.

Spectrophotometric determination of the color of wine.  
A. V. Korotkevich. Vinadie i Vinogradarstvo S.S.R.  
N. No. 1, 20-11051). The use of a Pultsch spectrophotometer for the detn. of the wine color is described.  
White wines were used directly while colored wines were  
diluted 2-5 or 10-20 times before the detn. The max. absorption  
wave length for white wines (Klevting and Pedro) was 4300 Å,  
resp. The extinction values ( $E$ ) multiplied by the dilution  
factor were used for the detn. of the relative color intensities  
of wines and wine products. The detn. of the coloring substances  
in wine (in g/l.) was made by multiplying the  $E$   
values (corrected for the dilution) by the factor 0.025 computed  
from the Neubauer-Lawenthal const. of 0.00116 used for  
the detn. of tannin in red varieties of grapes and whites (C.A.  
48, 0815e); in case when the const. used is 0.008 the  $E$   
values are multiplied by 0.0375. E. Wiericki

Oxidizing reactions of wines. A. V. Korotkevich and K. A. Kurnetsova. *Vinodelie i Vinogradarstvo SSSR*, 11, No. 2, 10-12(1951).—A discussion of work carried out over the past 15 years on the importance of oxidizing reactions on the maturing of wines. The oxidation-reduction potential and the content of dissolved O<sub>2</sub> are the important factors to be studied. The authors describe their methods for characterizing wine as an oxidizing-reducing system. To ob-

tain the general oxidizability of wine, the wine is treated with a weak soln. of iodine at pH 3.8. Details are given for this analysis, which measures the amt. of easily oxidizable substances, like polyphenols, sulfuric acid, ascorbic acid, and essential oils. The maximal oxidizability of wines is estd. by treating the wine with permanganate, which gives an estimate of the more difficultly oxidizable substances, like sugars, etc., and various acids. Methods are also described for determining the general reducibility of wines (photometric destr. using indigocarmine dye), for the destr. of "tannins" (including polyphenols) oxidizable by gaseous O<sub>2</sub>, and for a general balance of oxidation-reduction effects.
